

October 2019 Tennessee State Climate Summary

Tennessee Climate Office * East Tennessee State University

Prepared by William Tollefson and Dr. Andrew Joyner

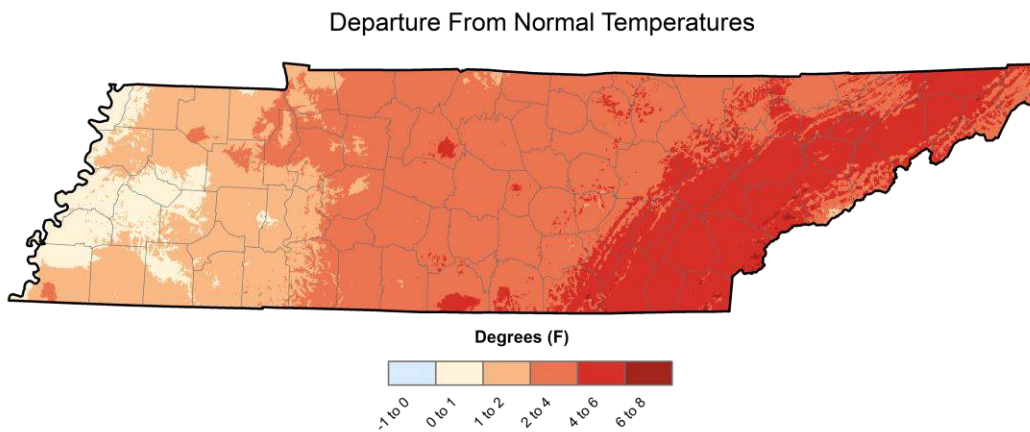

With contributions by Climate Data Representatives at University of Tennessee-Martin, Vanderbilt University, and University of Tennessee-Institute of Agriculture

Monthly Temperature Summary:

Major temperature shifts occurred during the month of October across Tennessee. The month started out in a continuation of the heat wave from September, with high temperatures in the mid-to-upper 90s during the first week of the month. Daily record high temperatures were set in Memphis (1st-3rd), Jackson (2nd & 3rd), Clarksville (1st-3rd & 5th), Nashville (1st-3rd & 5th), Crossville (1st-3rd), Chattanooga (1st-4th), Oak Ridge (1st-3rd & 5th), Knoxville (1st-3rd), and in the Tri-Cities (1st-4th), with Chattanooga reaching 100°F on the 2nd & 3rd. A strong cold front in the middle of the month brought below normal temperatures to West TN, and another cold front in the 3rd week of the month brought below normal temperatures across the state, but warmth returned to east Tennessee ahead of a strong cold front that swept the state on Halloween. On the 31st, high temperatures ranged from 48°F in Memphis in the southwest corner of the state to 76°F at the Tri-Cities airport in the northeast corner of the state ahead of the cold front. These weekly temperature patterns resulted in monthly mean temperatures that were well above normal in East and Middle Tennessee, and near to slightly above normal in West Tennessee.

October 2019 Mean Temperature

Stations with the highest mean temperature

NEWFOUND GAP	COOP	55.4
ROAN MOUNTAIN 3SW	COOP	56.5
COALMONT	COOP	58.2
MILAN EXP STN	COOP	58.3

Monthly Precipitation Summary:

The beginning of October was the peak of the flash-drought that affected the state from the end of August through September, with 100% of the state in some level of drought. However, several cold fronts and two post-tropical systems (Nestor and Olga) brought heavy rainfall during the rest of the month resulting in above normal precipitation across the state. October is generally the driest month of the year in Tennessee, and with high precipitation totals this year, over half the state recorded more than 200% the normal rainfall. West Tennessee recorded the highest rainfall totals, from Memphis northeast to Jackson and into northwest Middle Tennessee. This area had seven weather stations (including airport, CO-OP, and CoCoRaHS stations) that reported over a foot of rain during the month! At the end of the month, the cold front that swept the state on Halloween brought the first snowflakes of the season, with a trace of snow reported in Jackson and Pikeville, and snow showers in other cities across the state.

Drought Monitor:

The drought affecting the state from August and September reached its peak in the first few days of October, with 100% of the state shown as impacted by abnormally dry or drought conditions in the October 1st US Drought Monitor. However, the above normal precipitation produced weekly improvements in drought conditions. By the end of the month, drought conditions were cleared from West Tennessee, and most of Middle Tennessee. Southeast Tennessee, which has been drier than normal for the longest time period, and which did not get as much rainfall until the very end of the month, is still depicted with a small area of moderate to severe drought. If the wet pattern continues into November, this area will likely be cleared of drought as well.

The Month in Comparison:

Looking at scatter plots of the observed precipitation and average temperature compared to the precipitation and temperatures for the last 30-years, we can see that this October ranked among the wettest for several cities, and among the warmest for some as well. From West to East, the data for Memphis, Jackson, Nashville, Chattanooga, Knoxville, and Tri-Cities airports are shown below.

Memphis recorded its wettest October, and recorded slightly below normal mean temperatures.

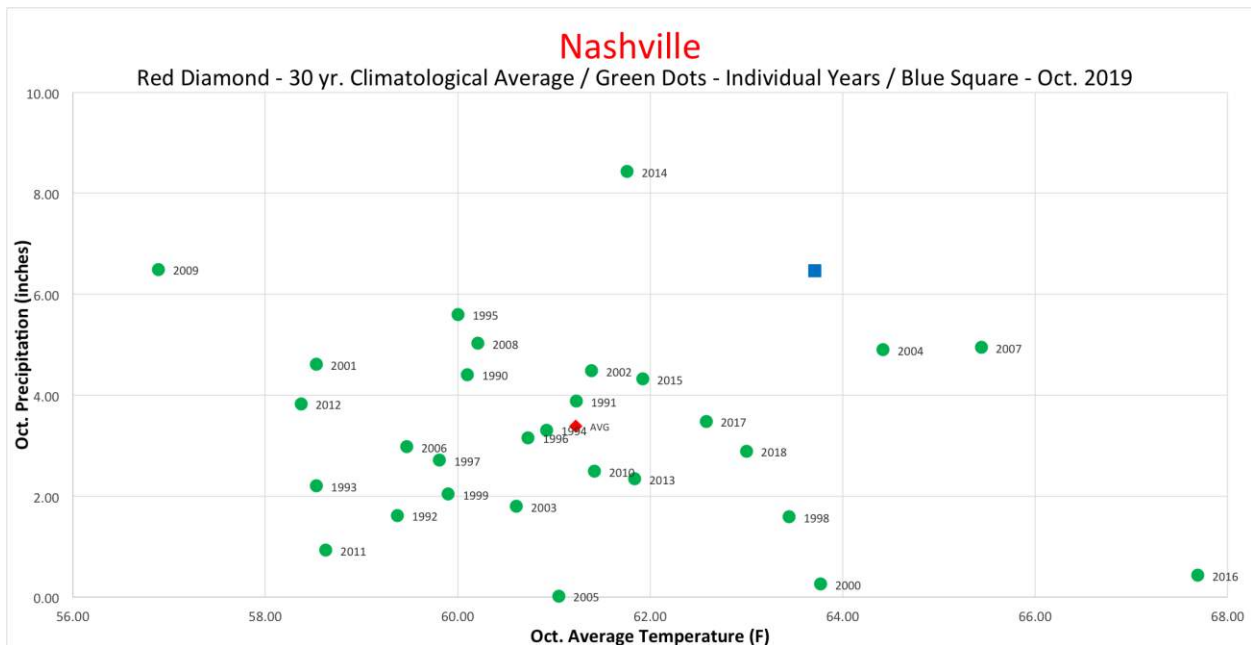

October 2019 Tennessee State Climate Summary

Jackson, also had its wettest October on record, but recorded slightly above normal temperatures.

Nashville recorded its 7th wettest October on record (3rd wettest in the last 30 years), and was warmer than normal.

Chattanooga had its third wettest October on record (wettest in the last 30 years), and the 10th warmest October on record (3rd warmest in the last 30 years).

Knoxville was wetter and warmer than normal.

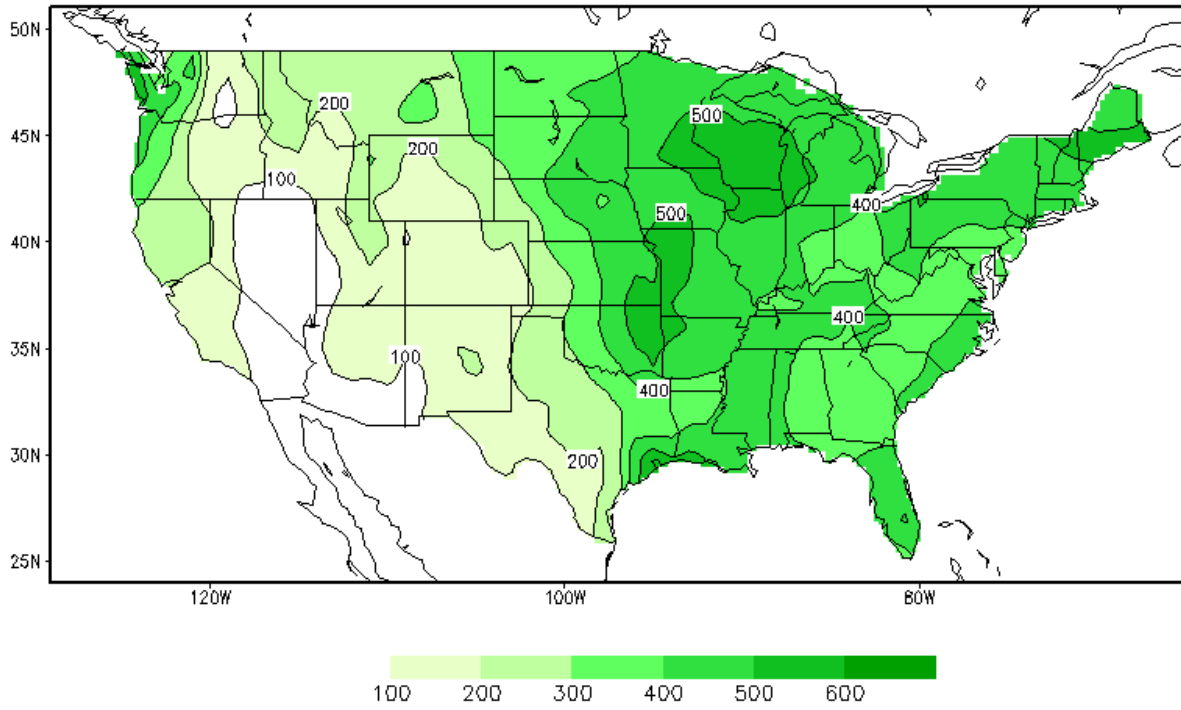

The Tri-Cities had its wettest October on Record, and the sixth warmest October on record (second warmest for the last 30 years).

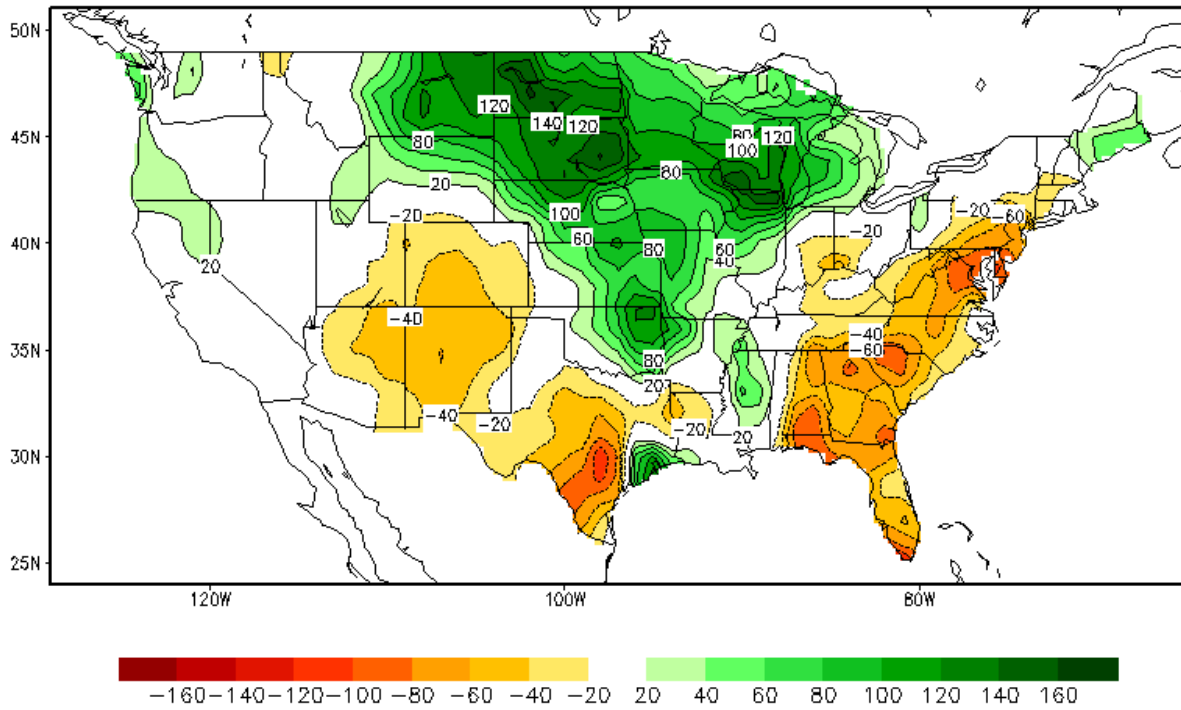

Soil Moisture:

Soil moisture coming into October was below normal in many areas of the state, however the above normal precipitation was able to provide soil moisture recharge through the month. The average soil moisture for the month came out to around 400mm across the state, which was normal to above normal in West Tennessee, but below normal in East Tennessee. Across the state there were increases of 40-100mm in soil moisture over the month.

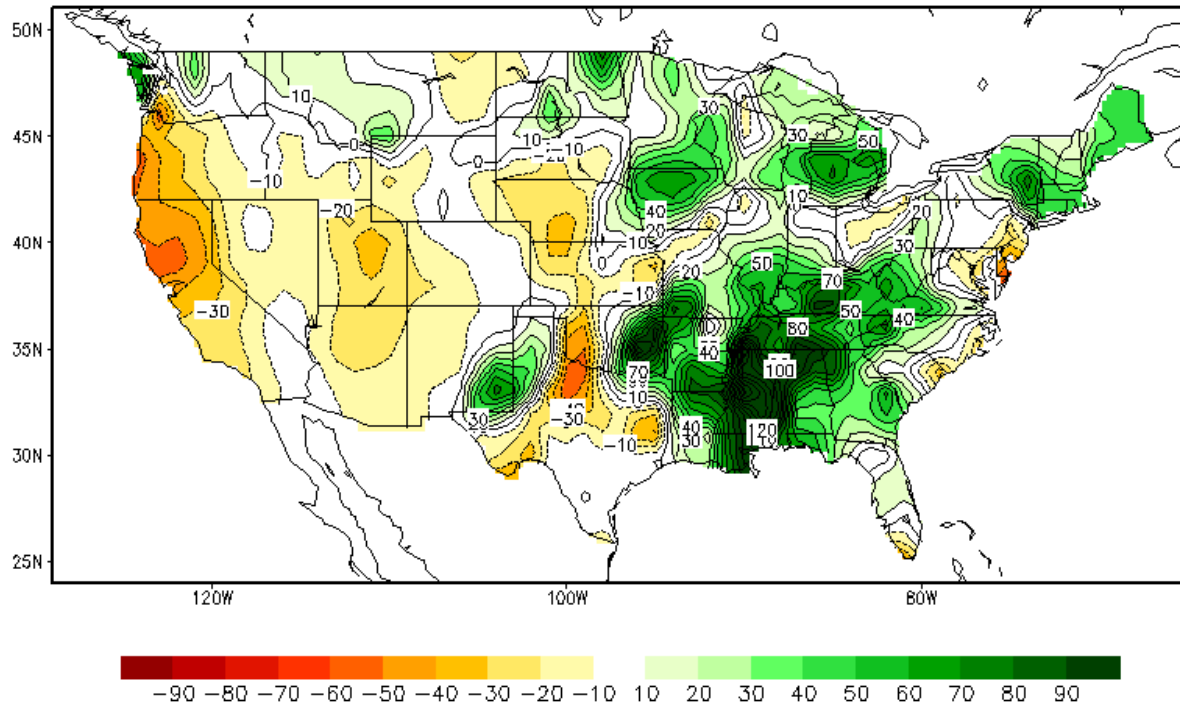

Calculated Soil Moisture (mm) OCT, 2019

Calculated Soil Moisture Anomaly (mm) OCT, 2019

Calculated Soil Moisture Anomaly Change OCT 31, 2019 from SEP.30

Streamflow:

Streamflow across the state was also at to above normal for the month, with most of the above normal streamflow in the western half of the state, which had more consistent heavy rains through the month.

Miscellaneous:

Crop Conditions from USDA: Hot and dry conditions persisted in the first week of the month, delaying the fall seeding of pastures, wheat, and seedlings. Tobacco harvests were completed in the first week of the month, with mostly fair to good crop conditions. The rains in October were very beneficial to agriculture and pastures, although it did slow harvests by reducing the amount of days for field work. Soybean harvests continued with yields of late-planted beans showing the detrimental effects of last month's hot, dry weather. Corn and cotton harvests also continued with most farmers continuing to post favorable yields. Pasture conditions improved with the added soil moisture, particularly those pastures with cool weather grasses. However, scattered frost kept pasture conditions from improving greatly. Scattered frosts occurred in the second half of the month, with a widespread frost and freeze event occurring on the 31st. At the end of the month topsoil moisture was rated 9% very short, 17% short, 64% adequate, and 10% surplus. Subsoil moisture was rated 11% very short, 28% short, 58% adequate, and 3 % surplus.

CROP PROGRESS					CONDITION					
Crop	This Week	Last Week	2018	5 Year Avg.	Item	Very Poor	Poor	Fair	Good	Excellent
	Percent					Percent

Winter Wheat – Planted	50	34	49	53						
Winter Wheat – Emerged	21	11	30	26						

Fire Danger: With the above normal precipitation during the month of October, the fire potential for November is below normal.

Fall Foliage: The fall foliage season was well underway in East Tennessee, with peak color occurring the last week of October in the higher elevations and northern Tennessee Valley. Near peak conditions were reported in the other parts of East Tennessee and the Cumberland Plateau. The strong storm system that swept the state with high winds and heavy rains on Halloween brought an early end to peak conditions in the mountains. The images below show foliage conditions in Washington (*left*) and Carter (*right*) Counties on October 26th and November 3rd respectively.

Snow: The first snowfall of the season occurred on Halloween, with snow showers reported from west to east on the tail end of a strong cold front. A trace of snow accumulation was reported at Jackson, and in Pikeville. Higher elevations in the mountains of East Tennessee also reported a dusting of snow in the overnight hours and morning of Nov. 1st.

Story of the Month:

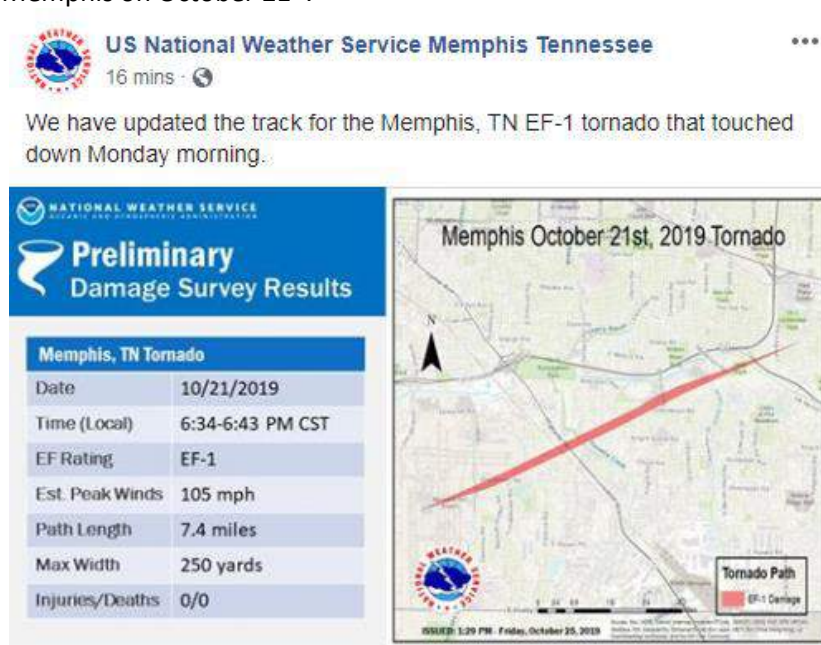

The main story of the month was the major shift from hot and dry conditions in the first couple days of the month to a very rainy pattern for the remainder of the month. This shift brought relief from drought conditions across the state, but the rain was accompanied by severe storms. Those storms, particularly at the end of the month, produced wide-spread wind damage and even two tornadoes, and resulted in two deaths and two serious injuries caused by falling trees.

The month started out hot and dry, daily record high temperatures were set somewhere in the state from October 1st to the 5th. Nashville recorded its highest ever October temperature (99°F), and broke the record for number of 90+ degree days in a single year, reaching 98 days this year.

Facebook post from NWS Nashville on October 4th, about record-breaking October warmth.

Starting after the 5th, the month switched to a rainier and more seasonable, although still above normal temperature pattern. A severe storm imbedded in a cold front on October 21st produced wind damage and a tornado in Memphis on October 21st.

A series of images showing the damage from a tornado and other severe wind in Memphis from WMCA.

The remnants of tropical storm Olga moved through portions of Tennessee the following week, along the western Tennessee River Valley, leaving a swath of severe wind damage from north Mississippi to western Kentucky. Multiple semi-trucks were blown over on the I-40 Bridge crossing the Tennessee River between Benton and Humphreys Counties.

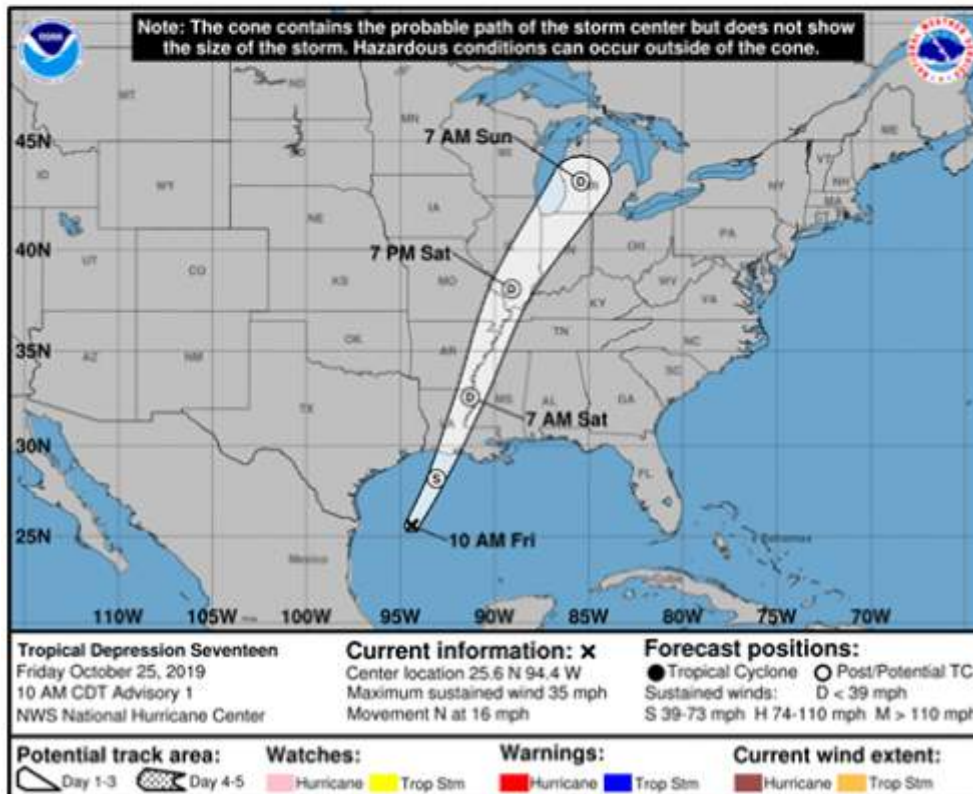

US National Weather Service Nashville Tennessee

...

25 October at 12:12 · 🌐

The National Hurricane Center has just named Tropical Depression 17 over the western Gulf of Mexico. This system will come onshore the coast of Louisiana tonight and then continue right up the Mississippi Valley tomorrow. TD 17 will merge with a low pressure system coming out of the southern Plains to give us the rain we're expecting this weekend. This merger of systems is not something we see very often, and it is rather late in the tropical season. We're just coming out of a late-summer/early-autumn drought, so the ground and the rivers can take on quite a bit of water without spilling over. Fortunately, the rain should be gone by the time we get up Sunday morning, so we'll at least have one decent day this weekend.

US National Weather Service Nashville Tennessee

28 October at 14:17 · 🌐

Saturday ended up being a very interesting weather day. The remnants of Tropical Storm Olga provided strong 40+ MPH winds for some locations across western Middle TN. The wind max developed due to rapid pressure falls near the low center. <https://www.weather.gov/ohx/20191026>

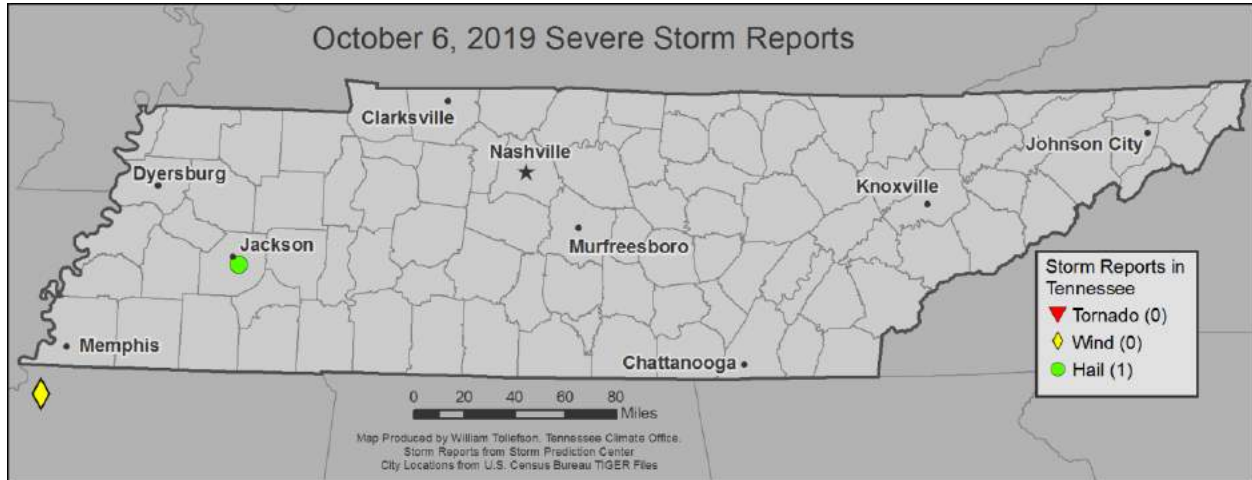

Overturned trucks on I-40 on Saturday Oct. 26th.

Storm Reports:

There were five days with severe weather reports during October resulting in a total of 2 tornadoes, 69 reports of severe wind damage, and 1 report of severe hail. These severe storms resulted in two fatalities and two critical injuries, one each on the 26th and the 31st, each caused by falling trees.

CPC Outlooks for the Next Month:

The NOAA climate prediction center outlooks for November show most of Tennessee has a 33% chance of below normal temperatures, with the exception of the southeast corner of the state. The western half of the state will likely see below normal precipitation patterns, with West Tennessee given a 40% chance of below normal conditions and western Middle Tennessee a 33% chance of below normal precipitation. The eastern half of the state has equal chances of recording above, below, or normal precipitation for November.
