

March 2020 Tennessee State Climate Summary

Tennessee Climate Office * East Tennessee State University

Prepared by William Tollefson and Dr. Andrew Joyner

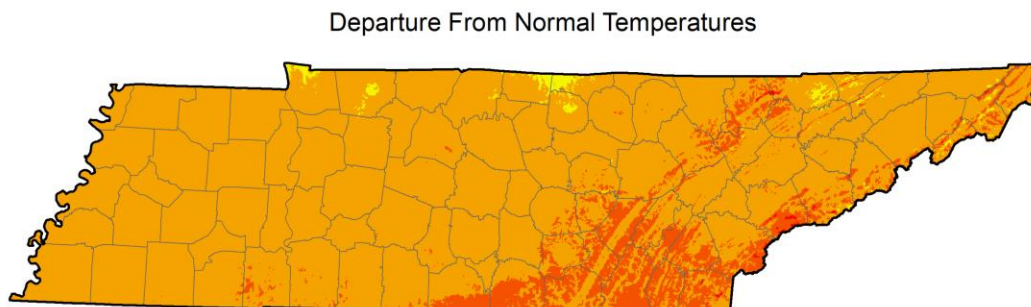

With contributions by Climate Data Representatives at University of Memphis, University of Tennessee-Martin, Vanderbilt University, and University of Tennessee-Institute of Agriculture

Monthly Temperature Summary:

The trend of warmer than normal mean temperatures in 2020 continued into March. With all areas of the state recording temperatures at least 3 degrees warmer than 30-year climatological normals. Once again East Tennessee saw the largest departure from normal, with many areas in the southeast corner of the state recording temperatures that were 6-8°F warmer than normal. The warmer than normal conditions prompted an early start to the growing season, and national weather service offices across the state began to monitor conditions for frost or freeze advisories by the end of the month.

March 2020 Mean Temperature

Stations with the highest mean temperature

Station Name	Station Type	Mean Temperature (F)
LIVINGSTON RADIO WLIV	COOP	63.1
UNION CITY	COOP	59.2

PORTLAND SEWAGE PLANT	COOP	44
NEWFOUND GAP	COOP	45.5
CROSSVILLE EXP STN	COOP	46.4
PICKETT STATE PARK	COOP	47.7

Monthly Precipitation Summary:

March also brought above normal precipitation to the state. Some small areas in the eastern-most mountains recorded slightly below normal precipitation (90-100% of normal) while all other regions recorded above normal rainfall. The southern sections of the state recorded particularly high rainfall totals for the month, with several weather stations recording over a foot of rain, more than double their normal monthly totals! With the above normal temperatures, almost all precipitation occurred as rainfall this month, with only two weather stations reporting more than a trace of snowfall.

Drought Monitor:

Most of the state has been recording above normal rainfall for the past several months, and the state remained free of drought concerns on the US Drought Monitor for the month of March.

Author:

David Simeral
Western Regional
Climate Center

**U.S. Drought Monitor
Tennessee**

March 31, 2020

(Released Thursday, Apr. 2, 2020)

Valid 8 a.m. EDT

Intensity:

- None
- D0 Abnormally Dry
- D1 Moderate Drought
- D2 Severe Drought
- D3 Extreme Drought
- D4 Exceptional Drought

The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. For more information on the Drought Monitor, go to <https://droughtmonitor.unl.edu/About.aspx>

droughtmonitor.unl.edu

The Month in Comparison:

Looking at airport weather stations with at least 30-years of climate data, we can see that across the state March 2020 was warmer and wetter than normal; the Tri-Cities airport proved to be the largest outlier, with March 2020 being the second warmest and second wettest march for the past 30 years. The other airport stations also recorded their top-5-warmest and wettest Marches in that time period.

March 2020 Tennessee State Climate Summary

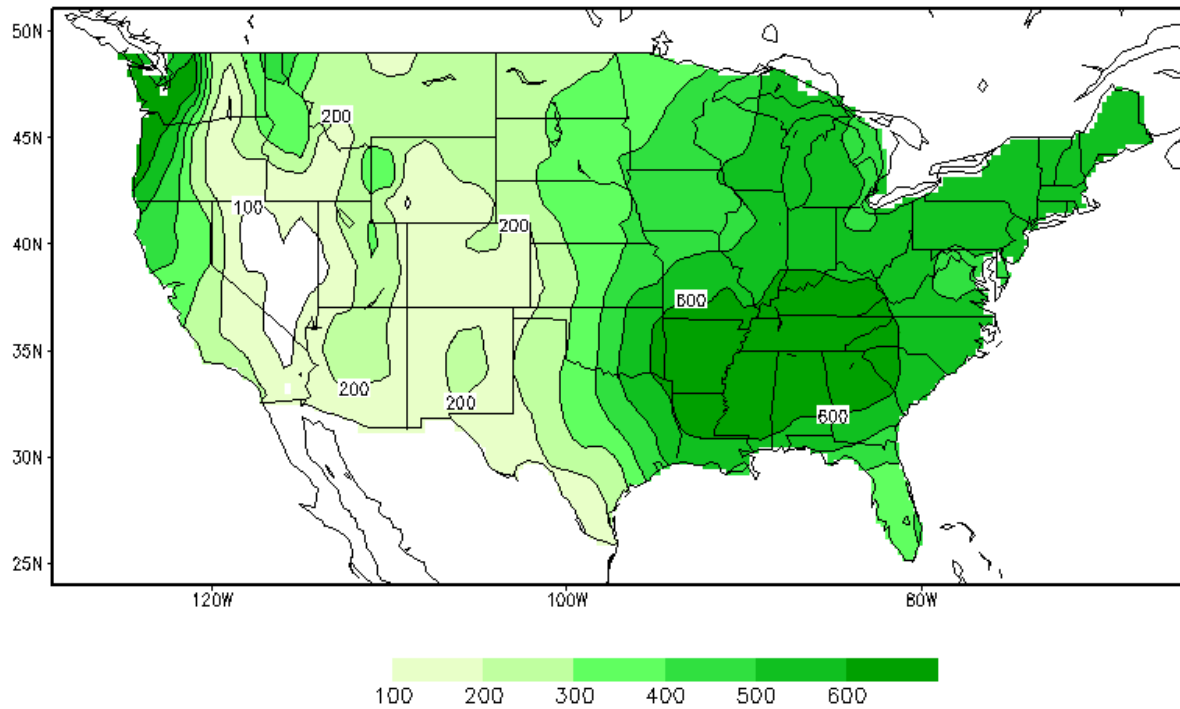

March 2020 Tennessee State Climate Summary

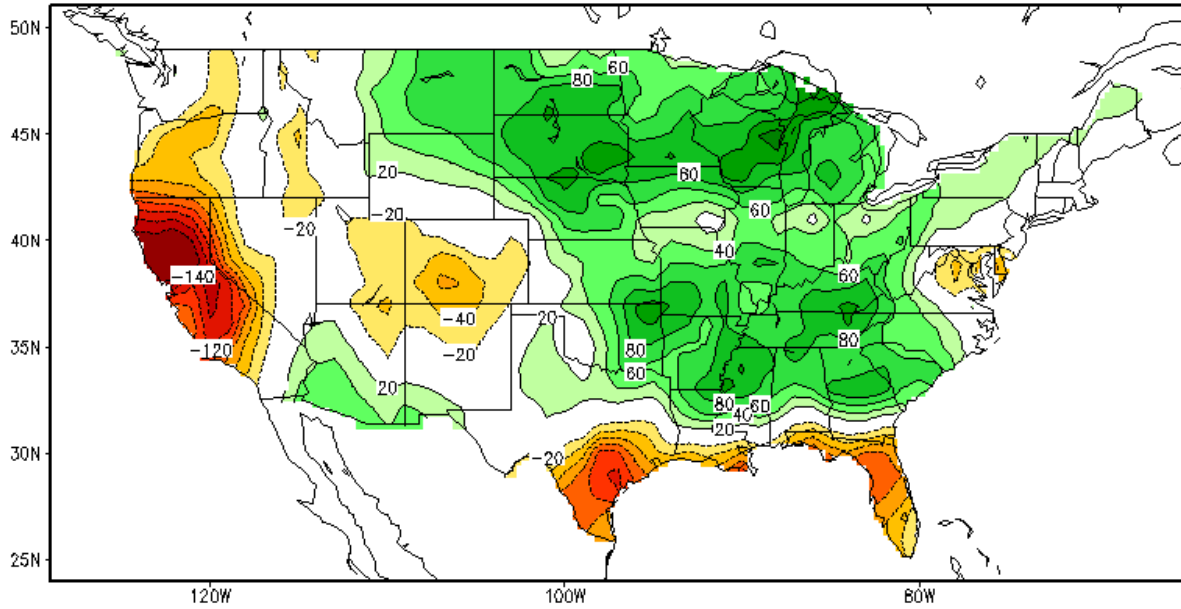

Soil Moisture:

Soil moisture across the state was calculated to be above 600 mm, which was 60-100 mm above normal for this time of year. Despite higher than normal rainfall for almost all locations, March brought less rain to East Tennessee than February did. This combined with above normal temperatures, produced some drying of soil moisture in the eastern half of the state. This drying was probably a good thing, as farmers begin seasonal planting and fieldwork.

Calculated Soil Moisture (mm)
MAR, 2020

Calculated Soil Moisture Anomaly (mm) MAR, 2020

Calculated Soil Moisture Anomaly Change MAR 31, 2020 from FEB.28

Streamflow:

Matching the above normal precipitation, all streamflow gauges across the state were at normal to above normal flow. The only stations recording normal flow were in the northeast corner of the state, where precipitation was closer to normal, and stations located on streams that were flowing from the North Carolina side of the Appalachians where below normal precipitation was recorded in March.

Miscellaneous:

Crop Conditions from USDA: Crop progress and condition reports have ended for the season; the USDA will resume issuing the reports for the state in April 2020.

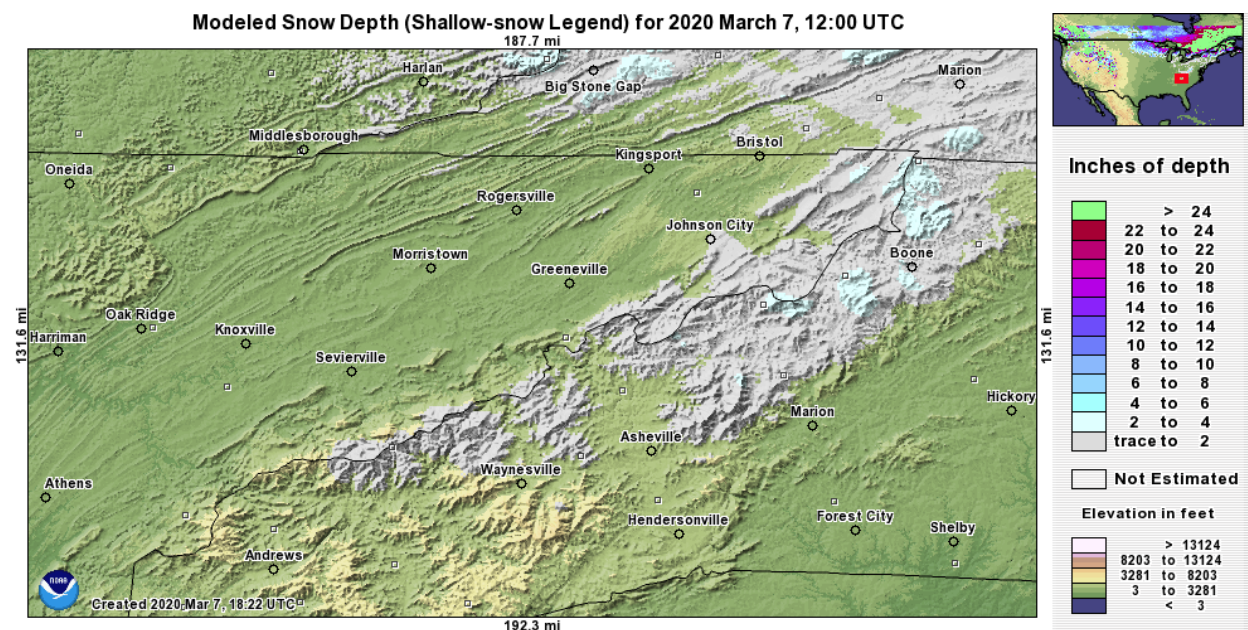

Fire Danger: Due to the wetter than normal conditions for the past several months, the significant wildland fire potential is forecast to be below normal going into April.

Spring Green Up: The warmer than normal temperatures combined with plenty of moisture jump-started spring across the state. The Growing Season Index map from the national interagency fire center is showing 70-90% of vegetation across the state has begun its growing season.

Snow: As mentioned in the precipitation section of the report, almost all precipitation during March came in the form of rainfall. The only day with widespread snowfall reports was March 7th, and accumulations were confined to the higher mountain elevations.

Story of the Month:

The major weather story of March was the deadly tornado outbreak that hit the state in the overnight hours of March 2nd into the 3rd. Severe storms produced a series of tornadoes and severe wind and hail reports stretching from Gibson County in West Tennessee through Nashville and Putnam County, ending in Morgan County on the Cumberland Plateau. These storms were responsible for the deaths of 29 people (21 people in Putnam County alone) and an additional 310 injuries.

March 3rd was also the “Super Tuesday” primary election in Tennessee, and tornado damage in parts of Nashville required the closing of some polling locations. The date also brought memories of the Super Tuesday tornado outbreak in 2008, which affected Tennessee and other states in the region.

The National Weather Service determined that the tornado that hit Putnam County was an EF-4 with winds of up to 175 mph, the tornadoes in Davidson, Wilson, and Smith counties were EF-3s with winds up to 165 mph, and the tornadoes that hit Benton and Carrol Counties were EF-2s with winds up to 125 mph.

US National Weather Service Nashville Tennessee

22 hrs · 🌐

NWS Survey Update - 3/4/2020

Putnam County

- EF-4 tornado (175 mph maximum winds)
- 18 fatalities, 88 injuries, 3 still missing
- Path and width will be determined in coming days
- First violent tornado in NWS Nashville forecast area (38 counties in Middle TN) since 4/10/2009 (Good Friday tornado)

Davidson/Wilson/Smith Counties

- EF-3 tornado (165 mph maximum winds)
- 50.25 mile long path, John C Tune area to 3.50 miles west of Gordonsville (subject to change as teams complete survey)

US National Weather Service Memphis Tennessee

3 March at 17:49 · 🌐

🚨 Preliminary Survey Results for Benton Co(TN) and Carroll Counties 🚨
Preliminary damage surveys indicate at least an EF-2 tornado in Benton County as well as an EF-2 tornado in Carroll County.... both with wind speeds of approximately 125 MPH.

US National Weather Service Morristown Tennessee

...

3 March at 17:59 · 🌐

The same system that affected middle Tennessee late last night also affected eastern parts of the state. A team was sent out today to survey potential tornado damage in Morgan county, and we did confirm a tornado there. The results from that survey are listed below:

Where: Western Morgan county

Rating: EF-0

Peak winds: 85 mph

Track length: 3.7 miles

Max width: 200 yds

Start: 2 miles southeast of High Point

End: 5 miles south-southeast of Deerlodge

[#tnwx](#)

In Nashville, the 5-Points neighborhood in East Nashville experienced its third tornado over the past 100 years, with other tornadoes affecting the neighborhood in 1933 and 1998.

US National Weather Service Nashville Tennessee

3 March at 08:09 · 🌐

Hey Everyone. NWS Nashville and their families are okay. Thank YOU to all that have messaged us so early this morning. We know a lot of you are hurting and concerned about friends, family members, and loved ones. Our hearts are with you Nashville & suburbs east to Cookeville. It will be a long day, week, month ahead. We will begin the long process of damage surveys first thing this morning. Please be patient with us as it will take time to gather the data and make official determinations/ratings. I know you all want that info NOW, but patience is key. We've received a TON of questions on how does this March 3, 2020 tornado compare to the April 16, 1998 and March 14, 1933 downtown Nashville tornadoes. The March 3, 2020 Nashville tornado had a path near but not quite exactly like the tornadoes of April 16, 1998 & March 14, 1933. (See map below.) However, all 3 tornadoes struck the 5 Points area of East Nashville. The 1998 and 1933 tornadoes occurred during the afternoon/evening, while the 2020 tornado occurred in the middle of the night. This is also another tornado event occurring on "Super Tuesday" in Middle Tennessee. The one many remember is the 2008 tornado outbreak. That was also a nighttime tornado event (but AFTER the voting) that caused significant damage across Middle Tennessee. In the 2008 Super Tuesday tornado event, downtown Nashville was spared.

Storm Reports:

**Storm Reports are based on filtered NOAA Storm Prediction Center data. Future quality control checks may change the official record of severe events, please see spc.noaa.gov for any updates.*

There were three days with severe storm reports during the month, producing a total of 14 tornado reports, 137 reports of severe wind, and 16 reports of severe hail. The severe weather outbreak in the overnight hours of March 2nd into the 3rd produced several fatal tornadoes, and sadly, 29 people lost their lives and an additional 310 people were injured.
