

# May 2021 Tennessee State Climate Summary

Tennessee Climate Office \* East Tennessee State University

Prepared by William Tollefson and Dr. Andrew Joyner

With contributions by [Climate Data Representatives](#) across the state

## Monthly Temperature Summary:

May 2021 averaged cooler than normal across most areas of the state, with a majority of Tennessee reporting temperatures 1-4°F below normal. The middle of the month (May 10-16) brought some of the coolest conditions with mean temperatures for that 7-day period 8-10°F below normal and low temperatures dipping into the low 40's and even 30's for many locations. The Jackson Airport set daily record low temperatures on May 15 (40°F) and May 16 (42°F). While temperatures stayed near or below normal for most of the month, a brief heat wave brought high temperatures into the upper 80's and low 90's across the state from May 25-27. During this heat event, the Tri-Cities airport set a daily record high for May 25 (90°F). Cooler than normal conditions returned at the end of the month, over Memorial Day weekend, with record-low daily high temperatures set on May 30 at the Memphis (61°F) and Jackson (62°F) airports.

CHEROKEE TENNESSEE	RAWS	59.1

### Monthly Precipitation Summary:

May 2021 was drier than normal for most areas of the state, but heavy rains associated with thunderstorms in the first week of the month and widespread rains in the last week of the month resulted in a few areas with above normal precipitation for May. East Tennessee was generally the driest part of the state with a large portion of the region recording less than 75% of the normal monthly precipitation totals for May. The Smoky Mountains and nearby foothills were an exception, with portions of Blount and Sevier counties recording more than 125% of their normal monthly precipitation. Several rounds of severe thunderstorms trained over areas in West and Middle Tennessee in the first week of the month, producing heavy rainfall totals (of up to 5 inches in some areas). These areas recorded above normal precipitation for the month.

### The Month in Comparison:

Comparing the average temperature and total precipitation for May 2021 to the values for May over the past thirty years, the cooler than average temperature pattern is visible. Jackson was a standout, with 2021 being the second coolest May of the past thirty years for that city. Each location besides Jackson and Nashville also recorded less precipitation in 2021 than the average for the last thirty years, but it was not one of the top-five driest Mays in the period for any city.

May 2021 Tennessee State Climate Summary

May 2021 Tennessee State Climate Summary

### Drought Monitor:

Due to the drying trend observed over the past two months, outside of localized flooding rains from thunderstorms, some small areas of D0 (Abnormally Dry) conditions were introduced to Tennessee in the May 25 release of the U.S. Drought Monitor. These areas were centered around northeast Tennessee, the northern Cumberland Plateau and southwest portions of Middle Tennessee, and total to 7.91% of the state.

## U.S. Drought Monitor Tennessee

**May 25, 2021**  
(Released Thursday, May 27, 2021)  
Valid 8 a.m. EDT

Intensity:

- None
- D0 Abnormally Dry
- D1 Moderate Drought
- D2 Severe Drought
- D3 Extreme Drought
- D4 Exceptional Drought

[droughtmonitor.unl.edu](http://droughtmonitor.unl.edu)

The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. For more information on the Drought Monitor, go to <http://droughtmonitor.unl.edu/About.aspx>

### Soil Moisture:

Soil moisture averaged over 500mm, which was in the near-normal range for the month across the state. However, there was a lowering of soil moisture levels over northern portions of the state, with the northeast corner seeing the largest drop, around a 30mm decrease. The USDA Crop Weather Report for the week ending May 30<sup>th</sup> indicated that topsoil moisture was 5% very short, 21% short, 60% adequate and 14% surplus, while subsoil moisture was 2% very short, 18% short, 71% adequate and 9% surplus.

**Streamflow:**

Heavy rains in the first week of the month and in the last days of the month produced monthly mean streamflow that was in the normal or above normal range compared to historical flow rates in May across the state. Northeast Tennessee proved the exception where several stream gauges averaged below normal streamflow for the month.

**Map of monthly streamflow compared to historical streamflow for the month of the year (Tennessee)**

Miscellaneous:

**Crop Conditions from USDA:** Heavy rains in West and Middle Tennessee at the beginning of May were a hindrance to planting and hay harvests. Drier than normal conditions for the latter parts of the month allowed for field work and hay harvests, but hay yields in Middle and East Tennessee were lower than normal due to drier and cooler than normal conditions. By the end of the month corn, cotton, soybeans, and winter wheat crops were all at or ahead of their 5-year average progress.

CROP PROGRESS					CONDITION					
Crop	This Week	Last Week	2020	5 Year Avg.	Item	Very Poor	Poor	Fair	Good	Excellent
Percent					Percent					
Corn - Planted	98	94	89	95	Corn	1	4	21	54	20
Corn - Emerged	87	78	77	88	Cotton	4	8	17	57	14
Cotton - Planted	92	70	62	84	Pasture	2	10	31	48	9
Cotton - Squaring	3	0	2	3	Winter Wheat	0	3	20	59	18
Soybeans - Planted	66	55	48	57	Cattle	0	4	23	61	12
Soybeans - Emerged	47	33	30	36						
Winter Wheat - Coloring	80	41	74	77						

**Fire Danger:** The National Interagency Fire Center significant wildland fire potential outlook for June shows all of Tennessee, along with the eastern third of the US, with normal chances for wildland fires in the coming month.

**Snow:** The Newfound Gap COOP weather station, in the Great Smoky Mountains National Park, reported a trace of snow (less than 0.01”) on May 12. This was the only weather station that reported snow accumulation during the month.

### Story of the Month:

Severe storms occurring May 3-6 were the main story for May 2021, resulting in 15 tornadoes and 56 reports of severe wind damage. The NOAA Storm Prediction Center recorded a total of 19 tornadoes in Tennessee during May, which is more than half of the annual average number of tornadoes that Tennessee recorded from 1995-2020! Tennessee has averaged 30 tornadoes per year in the 1995-2020 time period, but 2021 has produced 33 tornadoes so far across the state. The annual number of tornadoes from 1995-2020 is quite variable in Tennessee and ranges from as few as 9 in 2007 to 110 in 2011. Luckily all of the tornadoes recorded in May of 2021 were rated EF0 (the weakest category on the Enhanced Fujita scale for tornado strength), and there have been no fatalities caused by the tornadoes this year. However, severe thunderstorm winds did result in two fatalities, both caused by falling trees, in the first week of May.

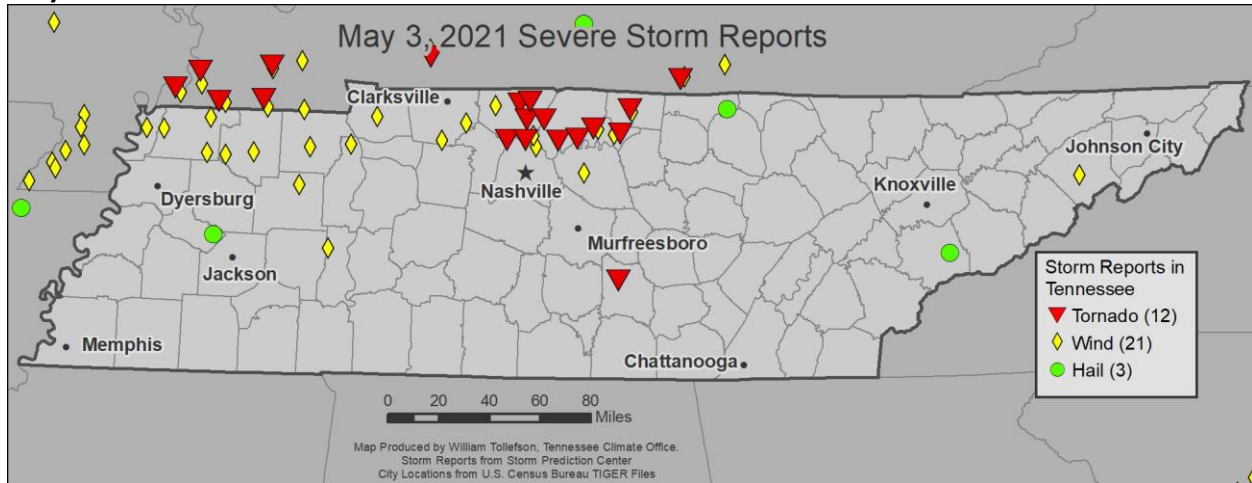

For more statistics on Tennessee Tornadoes, visit the Nashville National Weather Service Office’s tornado statistics [webpage](https://www.weather.gov/ohx/tntornadostats). (<https://www.weather.gov/ohx/tntornadostats>)

### Storm Reports:

*\*Storm Reports are based on filtered NOAA Storm Prediction Center data or local NWS storm reports. Future quality control checks may change the official record of severe events, please see [spc.noaa.gov](http://spc.noaa.gov) for any updates.*

There were five days in May with severe weather reports, resulting in a total of 19 tornadoes, 77 reports of severe wind damage, and 3 reports of hail 1-inch or larger in diameter. There were two fatalities and three injuries caused by the severe wind events this month.

### CPC Outlooks for the Next Month:

The NOAA Climate Prediction Center one-month outlooks for June indicate that all of Tennessee will have equal chances of normal, warmer or cooler conditions in June, but will likely be wetter than normal, with higher confidence along the southern border of the state.
