

Tennessee Drought Update

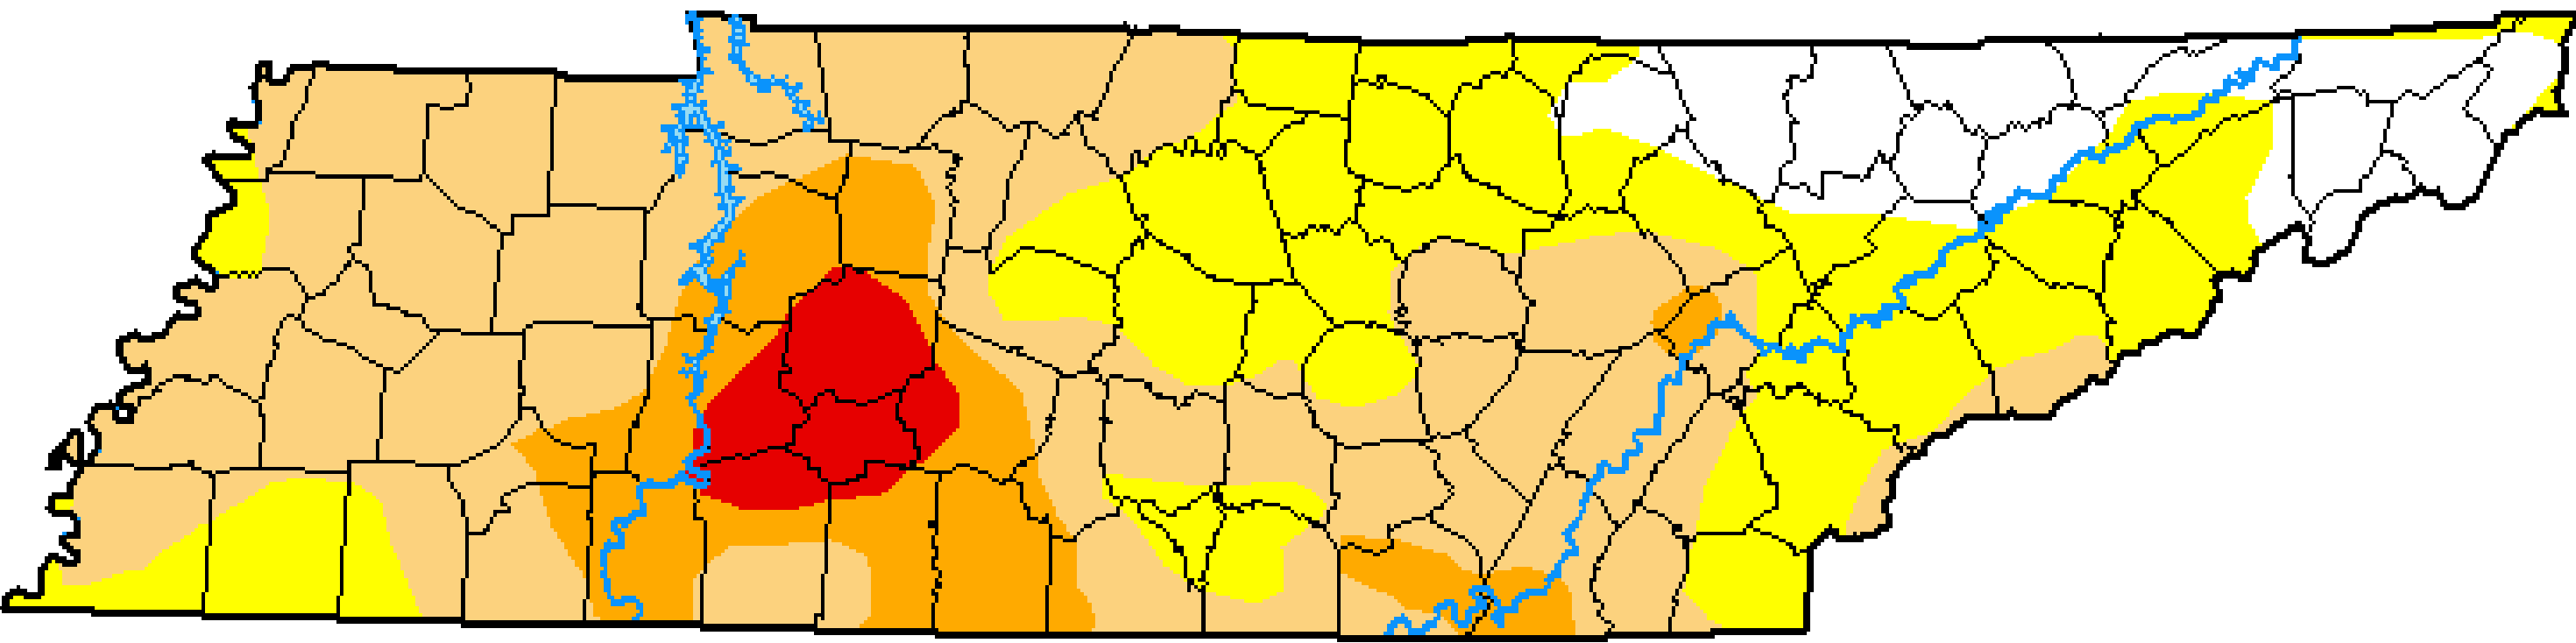

For the assessment period ending September 3rd, 2024

Statewide Condition Summary

This Week's Drought Monitor of Tennessee Map

From the US Drought Monitor, authored by Lindsay Johnson, NDMC with input from the Tennessee Climate Office

What's Changed? The majority of the rainfall Tennessee saw this past week came in the form of spotty thunderstorms that missed a large portion of the state. This has left many parts of Tennessee in a deeper rainfall deficit. Soil moisture levels are trending upward but are still very low. This week, CMOR recorded the most reports for the state this year. Around 100 reports highlighted failing crops, dry pastures, low or completely dry ponds, and necessary feeding and watering to cattle.

What's New? D0 – D3 conditions have expanded across the majority of the state. These degradations are the result of extremely high temperatures and lack of adequate precipitation.

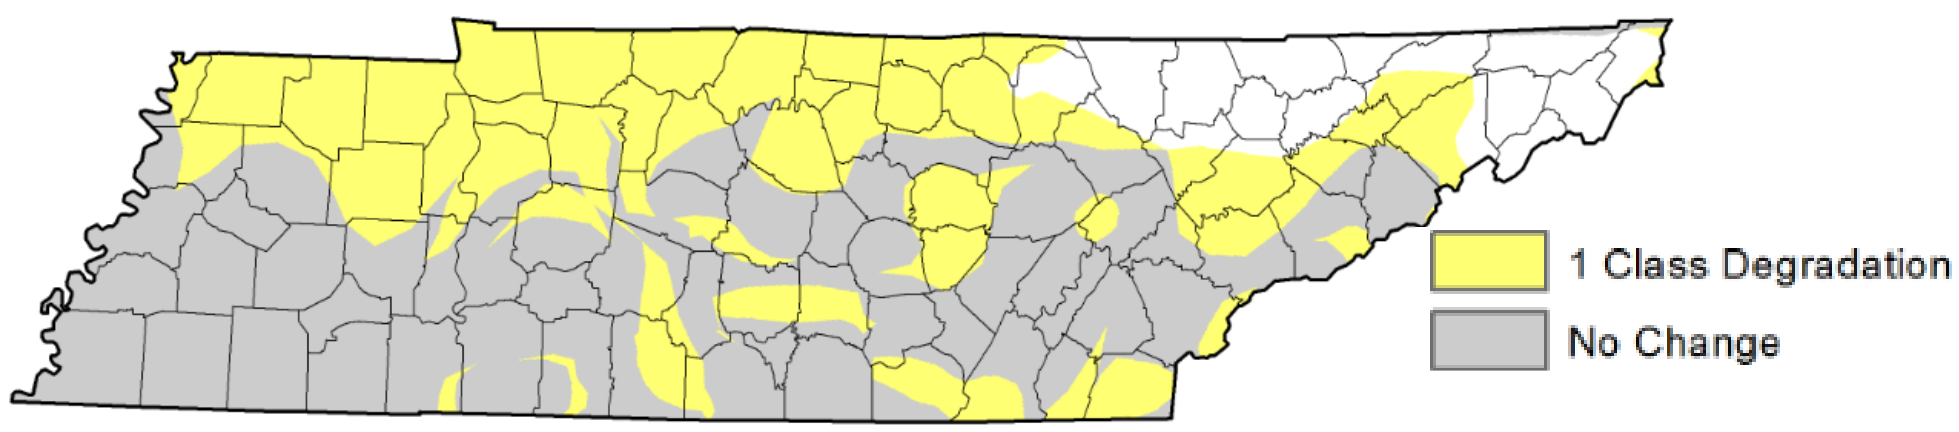

What's Next? Forecasts are predicting another week of marginal to no rainfall across the majority of the state. Drought conditions are likely to persist or worsen over the next week.

Lack of rainfall has led to deteriorating conditions across the majority of the state, with rapid deterioration in northwest Tennessee.

Statewide Coverage By Category

Change Since Last Week
